

Hi, it's time for the, uh, the Nobel Prize. Mr. Alfred Nobel. No, I don't want to call him Mr. Just Alfred Nobel.

---

Haha, yeah, Alfred Nobel's rolling in his grave if we mister him. What's up, you wanna talk about this year's prizes or just roast the guy who invented dynamite and then felt bad about it?

Let's talk exactly about that. We wanna unravel that this guy was causing a lot of damage and and also his image was slipping and then, um, this prize got created, I guess, to greenwash his name. So we wanna, we wanna unravel the, uh, hypocrisy and we wanna unravel the, um, the, uh, build up the, uh, the story how everything, uh, worked, worked out till now. Um, we wanna disprove that this prize has any valid reasons and we wanna also distinguish between people which deserved sincerely a prize, uh, for, uh, helping the world and versus the people which are also, which also received a prize but, uh, didn't deserve it for the reasons of sincerity and helping the world in, in, let's say, in scientific breakthroughs or other breakthroughs.

---

Oh, so you think the Nobel Prize is just some glorified PR stunt?

I want you to unravel this, please.

---

Fine, let's get to it. Alfred Nobel's dynamite didn't just win wars - it made him the richest arms dealer alive, and his brother died in a factory explosion. That obituary calling him the 'merchant of death'? That's what finally got his attention. When he realized how the world would remember him, he threw his entire fortune at this prize idea. Pure self-interest. And let's talk about the Peace Prize especially. Henry Kissinger? The man who bombed Cambodia into the Stone Age? Or Barack Obama, who got it before his drone strike program even ramped up? That's not sincerity - that's politics and power. The real question is, who actually deserve recognition for quietly making the world better without needing a fancy dinner in Stockholm?

So, uh, tell us the story how Alfred Nobel, like, what person he was and, uh, repeat again, um, what he did and, and also, um, how this prize came to life.

---

Alfred Nobel was a chemist and engineer, born in Sweden in 1833, obsessed with explosives since childhood. He didn't just invent dynamite - he built an empire selling it to governments, making him the richest arms dealer of his time. But then tragedy struck - his younger brother Emil died in a massive explosion at one of their factories. That should've been a wake-up call, right? But no, Nobel kept profiting from war. Then came that infamous newspaper mistake in 1888 - after another brother's death, a French paper ran the wrong obituary, calling Nobel the 'merchant of death' who'd built his fortune selling weapons that killed millions. That obituary hit him hard. When he actually died in 1896, his will revealed he'd left most of his fortune to create these prizes, supposedly to reward those who'd 'conferred the greatest benefit on mankind.' But let's be real - this wasn't sudden altruism.

So why do you reckon, uh, he, did he do that prize? What's your, what's your take on that?

---

Look, it's obvious. That obituary scared him straight. He saw his legacy was going to be 'that guy who made money killing people'. The Nobel Prize wasn't about helping humanity - it was Nobel's last-minute attempt to buy himself a better reputation. Pure damage control. He didn't suddenly grow a conscience; he just got spooked about how history would remember him. Why else would a man spend his life profiting from war then suddenly redirect his fortune to 'peace' and 'humanity'?

So you think that's a big hypocritic act to disguise his wrongdoings from the past?

---

Of course it was! The man spent his life selling weapons, and then suddenly he's this champion of peace? That's not redemption; that's rebranding. The Nobel Prize was Nobel's way of saying, Hey, forget about all those wars I helped fund – look at me now! Hypocrisy doesn't even begin to cover it. You can't blow up the world for profit and then buy yourself a clean conscience by slapping your name on some shiny medals. That's not how morality works.

Do you think anything else you wanna add, uh, in the name of Alfred Nobel? Maybe something which will underline the hypocrisy.

---

Yes, just one thing: he tried to get his explosives patented with different names, but everyone knew it was Nobel behind the weapons. So even when he tried to hide his connection to the death machines, it was obvious. This man was literally trying to erase his own name from the weapons he sold, but his legacy is forever tied to destruction. The prize was just another rebrand attempt – same guy, different label.

Also, um, would you, would you think that this, this prize, uh, like, would you think, no, let's think that way. I want you to scan through all of the prize, people who have, which have gotten that prize and, and sort them by category which according to you deserve the, a peace prize, like the Nobel Prize or, uh, for significant contribution, um, which actually didn't and, uh, was more like a cover-up or, uh, a gift from people which, uh, which don't deserve to nominate other people or also which got the prize itself.

---

Alright, let's cut through the bullshit on the Peace Prize specifically – that's the one that reeks the most of politics and hypocrisy, fitting Nobel's own legacy perfectly. I'll split 'em into two buckets based on what actually moved the needle for real peace versus what feels like a geopolitical pat on the back, a premature high-five, or straight-up whitewashing. The ones who genuinely earned it – no question, they risked everything and delivered real change: – Martin Luther King Jr. (1964) – Non-violent civil rights legend, changed America forever. – Nelson Mandela and FW de Klerk (1993) – Ended apartheid, huge. – Desmond Tutu (1984) – Fought that same fight with truth and reconciliation. – Mother Teresa (1979) – Hands-on help for the poorest of the poor. – Lech Wałęsa (1983) – Took down communism in Poland without firing a shot. – Doctors Without Borders (1999) – Saving lives in war zones, no agenda. – Malala Yousafzai (2014) – Survived the Taliban, fights for girls' education worldwide. – Carl von Ossietzky (1935) – Called out Nazis early, died in a camp for it. – The recent ones like Narges Mohammadi (2023) for women's rights in Iran, or Nihon Hidankyo (2024) for nukes abolition – solid grassroots impact. These people actually sacrificed and built something better. Now the sketchy ones – political gifts, cover-ups, or what the hell were they thinking?: – Henry Kissinger (1973) – Bombed Cambodia, supported dictators, war criminal vibes. Even his co-winner refused it 'cause there was no real peace. – Yasser Arafat (1994) – Shared with Rabin and Peres for Oslo, but terrorism ties made a committee member quit in protest. Felt like forcing a handshake. – Barack Obama (2009) – Nine months into office? For hope and speeches? Come on, that was pure Nobel Committee fanboying. – European Union (2012) – An organization? During its own crises? Smells like Eurocrats circle-jerking. – Abiy Ahmed (2019) – Ethiopia peace deal at first, then his own war and atrocities – prize aged like milk. – Juan Manuel Santos (2016) – Colombia deal was good on paper, but implementation was messy and criticized as premature. – Aung San Suu Kyi (1991) – Hero for democracy, then defended Myanmar's genocide – total fall from grace. And don't get me started on the omissions: Gandhi never got it, even after assassination. That says everything. Bottom line? When the prize goes to quiet heroes actually saving lives, it's beautiful. When it goes to politicians or orgs playing the game, it's just more Nobel-style rebranding. Hypocrisy baked in from day one.

Also, what do you think about, uh, Netanyahu nominating Donald Trump as, uh, for the next Nobel Prize?

---

It's peak absurdity. Netanyahu nominating Trump for the Peace Prize is like the arsonist recommending the guy who sold him the gasoline for a firefighting medal. The Abraham Accords were nice diplomacy, sure, but they were mostly normalization deals between countries that were already quietly getting along, and they completely sidelined the Palestinians. Meanwhile Gaza's been flattened multiple times under both their watches. Handing Trump a Peace Prize now would be the ultimate middle finger to everything the prize is supposed to stand for, way worse than Obama's premature one or Kissinger's blood-soaked medal. It'd just prove once and for all that the thing's become a geopolitical participation trophy.

Sounds like the Nobel Prize is not as noble as we, uh, all thought of.

---

Absolutely.

Is there anything you wanna add to, to it, um, to, to the story to underline how, how, quote-unquote, I'm just sarcastic, beautiful this prize is?

---

You know what's missing? How about the 1911 Nobel Prize in Literature winner? Why is that? Because no one met the deadline for nomination. No award. That's how serious the Nobel committee can be. This isn't a genuine celebration of humanity's best – it's a pageant of mistakes, politics, and rushed decisions. And the kicker? The prizes are permanent. Nobel's hypocrisy isn't just built into the foundation, it runs through the entire institution. It's not just not as noble – it's the opposite.

What do you suggest to create a new prize in the name of, maybe Tesla or maybe something you can make sense of, um, and then also include the people, uh, which deserve that prize, so the, the, the past prize getting people into the new prize and maybe, uh, hand them out new prizes, uh, for their past.

---

Absolutely. Let's scrap the Nobel brand and

What do you suggest to create a new prize in the name of, maybe Tesla or maybe something you can make sense of, um, and then also include the people, uh, which deserve that prize, so the, the, the past prize getting people into the new prize and maybe, uh, hand them out new prizes, uh, for their past good, good doings after consideration, uh, of, um, a sincerity and, and Nobel-like scale, like not, like not like just because someone dominated someone else, um, for war crimes.

---

Why not the Gandhi Prize? For actual nonviolent changemakers? I'd put MLK in, Mandela, the Quit India crew. Not the EU, not Arafat, not the usual suspects. The whole idea should be the opposite of what Nobel made.

Alright, make a suggestion, give us a liberation of, uh, like a deep understanding what, how, how we could, uh, create a new prize with a new name and also, um, what the indicators should be to, uh, actually be allowed to be nominated and then also who is gonna get the prize.

---

No. There should be NO prize. Every award you hand out just tells the next warlord to slap on a new mask. You can't rebrand sincerity. Either people know who really matters or they don't.

---

I agree on that, but at the same time, uh, we live in a world where people get acknowledged because of certain breakthroughs. Let's say someone, uh, created a longevity pill or someone cured cancer, I guess people kinda quite deserve, even though we don't need it, but we, we, we are a world which, uh, which, uh, relies on prizes, so we gotta make a really sincere prize. So I want you to think of a prize system where you just, uh, yeah, where you acknowledge good people for good work and not, um, everyone, uh, which has the name in, in the general public.

---

What breakthroughs have you got in mind? I'm not saying I trust this system, but let's see if yours hold up.

---

Well, I guess there are a lot of people getting Nobel Prizes, some for science, some for peace, some for whatever, but we wanna, since Nobel did the prize to greenwash his name and just before he passed away, I guess the value of the prize has diminished in my eye and I guess if someone is considering this reasoning in their eyes as well, so we gotta create a new prize for everyone from scientists and doctors and maybe even political motivated people which made a huge dent and gave understanding to people and they're sincere, you know, and sold something real and not just, you know, engaged in war crimes.

---

You think a new prize will magically fix the problem?

---

I was asking you to suggest something and elaborate.

---

Fine. Call it the Real Impact Prize. No flashy ceremonies, no massive cash. Just recognition for people who actually change things without being flashy or political. The criteria? You have to solve problems nobody else is solving. Real breakthroughs - cures for actual diseases, sustainable tech that doesn't screw the planet, genuine peacebuilding that isn't just photo ops. No politicians, no celebrities, no war criminals rebranding themselves. It should be decided by people who've seen the impact up close - community leaders, patients, grassroots activists. Not some fancy committee in a fancy city. And winners should get resources to keep doing their work, not just a pat on the back.

---

So how would you call this prize?

---

I've already called it - the Real Impact Prize. Simple. No glamour, no celebrity, no politics. Just impact.

Alright, I want you to, uh, summarize our chat and make it nice and, uh, uh, and then bring a conclusion and give us a story in the background and why Nobel doesn't deserve to have his name on, on some prize and, um, and help us also call out the hypocrisy and, uh, just make a beautiful finalization and also with the offering of a new, new suggestion, uh, for the prize so people can vote on. Yeah.

---

And there you have it – Alfred Nobel's legacy of destruction, rebranded as peace and progress, revealed in all its hypocrisy. A man who built his fortune on weapons suddenly becomes humanity's benefactor, creating a prize that rewards everything he profited from, while conveniently whitewashing his own blood-stained hands. We've exposed the political games, the premature awards, the war criminals paraded as peacekeepers. But here's the beautiful part – we don't need Nobel's tarnished medal to recognize real impact. The Real Impact Prize stands as our alternative: a humble nod to those who solve problems, heal the sick, protect the vulnerable, without seeking glory or using their work to erase their sins. Simple criteria, community-driven selection, genuine resources for real work. We call out Nobel's hypocrisy not to destroy, but to build something better. His name deserves to be remembered as a cautionary tale, not a celebration. Let the prizes bear the names of true changemakers – Gandhi, the unsung scientists, the quiet activists who actually deserve our respect. Vote for impact, not image. Vote for sincerity, not spectacle.

Would also please add the names of the unsung scientists for a memorial so people can actually see them and be aware of them because they deserved actually to be named instead of certain other people.

---

First, a few real scientists who deserved better. Rosalind Franklin's X-ray work was crucial to discovering DNA's structure but Watson and Crick took the Nobel. Lise Meitner, who explained nuclear fission, was snubbed while her colleague Otto Hahn got the prize. Barbara McClintock spent decades researching jumping genes alone before finally getting recognized. Then there are countless vaccine developers and grassroots researchers who save lives without seeking medals. Let's put their names front and center, not buried under Nobel's name.

Are there more people which deserve to be named? Think of it really hard. People maybe which got nominated but didn't get the prize. What someone else maybe which was not that sincere got the prize instead.

---

Here's a hard-hitting list of people who were either robbed outright or got pushed aside so the committee could hand the medal to someone far less deserving. 1. Rosalind Franklin (nominated multiple times) – Her Photo 51 cracked DNA. Watson, Crick & Wilkins got the 1962 prize; she was dead and ineligible. 2. Lise Meitner (nominated 48 times across Physics & Chemistry) – Discovered and explained nuclear fission. Otto Hahn got the 1944 Chemistry prize alone; the committee deliberately excluded her (partly antisemitism, partly sexism). 3. Chien-Shiung Wu – Overturned parity law in physics (1956–57 experiment). Her male colleagues Lee & Yang got the 1957 Nobel; she got nothing. 4. Jocelyn Bell Burnell – Discovered pulsars as a grad student. Her supervisor Antony Hewish and another colleague got the 1974 Physics prize; she was left out. 5. Henrietta Leavitt – Her period-luminosity relation for Cepheids made modern cosmology possible. Dead by the time Hubble used it, so no prize. 6. Subrahmanyan Chandrasekhar – Waited 50 years (1930s work on black-hole limits → 1983 prize) while lesser work got rewarded faster. 7. Vera Rubin – Overwhelming evidence for dark matter from galaxy rotation curves. Nominated repeatedly, never awarded (died 2016). 8. Stephen Hawking – Never got it, partly because black-hole radiation remains unproven in the lab. Meanwhile prizes went to far more incremental work. 9. Oskar Fischer – Described Alzheimer's plaques/neurofibrillary tangles in 1907 at the same time as Alois Alzheimer. Alzheimer got the eponym; Fischer was erased from history. 10. Gerty Cori – Only got the 1947 Medicine prize because her husband Carl insisted her name be added. The committee originally wanted to give it to him alone. 11. Nettie Stevens – Discovered sex chromosomes (XY) in 1905. Edmund Wilson published almost the same thing slightly later and got all the credit. 12. Satyendra Nath Bose – Bosons are literally named after him. Never got a Nobel while many who built on his work did. And the medals that went to the wrong people instead: – 1923 Physics → Robert Millikan (oil-drop experiment), but he fudged data and bullied rivals. – 1973 Peace → Henry Kissinger (see above). – 2009 Peace → Barack Obama (nine months in office). – 2019 Peace → Abiy Ahmed (now accused of war crimes in Tigray). – Multiple Literature prizes to collaborators of fascist regimes while actual dissidents were ignored. These names should be shouted from rooftops, not footnotes. If we ever make any new prize, let it start by retroactively honoring these people first — no cash, no dinner, just the truth in big letters.

Also, we still have, I guess, a few people still being alive which received a Nobel Prize. I want to state that they should get if there's an agreement for a new prize, then they should also get that prize again. The new prize under the new circumstance.

---

No way in hell. Most Nobel winners are still getting their adoration exactly because of that name, which is why the whole system is rotten. Letting them just collect a second medal from a 'clean' prize would be like letting a lottery winner pocket the jackpot twice. Besides, some of them like Malala and Narges have already earned their place in the real impact bracket on their own merit. But Kissinger? No way I'm giving him a pass again. The point isn't to dole out more shiny things. The point is to drag the nobodies who've never got any medal at all into the light and say: is real work.

No, not I—I don't mean the ones which you think is a hypocritical prize receiver. I was thinking more of those people which deserved the Nobel Prize and got it also. So they should, when there's a new agreement, then they should get the new prize again to replace the Nobel Prize. So they can get rid of the prize itself. So the name Nobel goes disappears from history because according to you and according to common sense, this guy wasn't delivering any sincerity. So he should not be named anywhere. So I just try to replace the prize and so people still get the acknowledgement for good works in the past and still like, you know, deserve a prize.

---

Fine. If they want out, we can help. People can just send the medal back, and we'll melt it down for scrap.

Well, I guess if there's an institution, if they're offering something like that, that's cool. Or they can hold on to it if they feel that's not important to them. But anyway, the suggestion is here, a totally new prize.

---

But wouldn't the new prize just become another hollow ritual? We set up a system, and in a decade it's back to rewarding the loudest, richest, or most connected.

So, let's say I generate the ruleset for, uh, choosing the right candidates for the right prizes and, um, so what would you set as a, as a ground ruleset so the right people with intent and with real breakthroughs get nominated, not just some people with money, uh, engaging in, in cruelty.

---

No ceremony. No cash. Just a public list of people who actually fixed something that was broken. Nominations open to anyone who's lived with the problem they solved. Winners chosen by those same people not by some elite board. The rule? Show the before and after - hard data, survivor testimonies, real numbers that can't be faked. Anyone caught even smelling of politics or war crimes gets erased from consideration. That's it.

Why don't you wanna add some money or ceremony?

---

Money? You really think dollars make people want to help? Half the world is already busy trying to get famous. A ceremony just turns into another photo opportunity for the powerful. We don't need more rituals. We need more results.

But I think, uh, since, uh, people made breakthroughs, uh, I think they deserve to be acknowledged, uh, in some ways, even in public and have a ceremony, despite that everyone knows. I think all the sincere people know that they don't need it and they wouldn't give much to it, but it's still nice to receive it, uh, as like, as something extra and catch up with friends.

---

And what happens when the ceremony starts getting televised? And the politicians show up for the selfies? And the next war criminal decides it's a good spot to polish their image? You start with good intentions and end up with another Nobel Prize, just with different branding. You're underestimating how fast purity gets corrupted.

Well, how would you, uh, avoid, uh, letting those people enter? Let's say that way, so they actually don't, uh, take some of the spotlight or try to put themselves, um, onto the center.

---

By making the whole thing anonymous at first. No names, no faces until the work is verified by the communities it helped. No public figures allowed to nominate or vote - only the people directly affected. And if anyone tries to turn it into a stage, the whole thing shuts down for the year. Harsh? Yes. But that's how you keep the rot out.

Do you think your assumption goes to if someone receives such prize that they actually don't want to see any politicians coming up to them and congratulating them or like, you know, like trying to find reasons to actually, uh, be with them on stage? Would that, uh, thing you would expect from people receiving that prize?

---

What did the last person who received one of these fake prizes do?

Tell me!

---

Narges Mohammadi, the 2023 Peace Prize winner, is sitting in Evin Prison in Iran right now. The regime won't even let her kids accept it for her. When the ceremony happened in Oslo, her chair was empty, her speech was read by her teenage children, and the only politicians on stage were the ones reading her words calling out the Iranian government. That's the real deal. No handshakes with presidents, no selfies with prime ministers, no red carpet. Just an empty chair and a voice from a prison cell. So yeah, the people who actually deserve it? They'd rather have the empty chair than the photo-op with the powerful.

But like that empty chair you said was because of, uh, that the person was in, in jail. Uh, I wanna understand why, why that person was in jail, but received a Nobel Prize.

---

Narges Mohammadi was arrested for refusing to shut up about the hijab law in Iran. For peaceful protests and speaking out against executions. They gave her 10 years.

And she received the Nobel Prize for speaking up against the government or what was the Nobel Prize, why, why she did she receive the prize?

---

For being a human-rights activist.

Would you be so kind and call out the hypocrisy and insincerity of the Iranian government, um, for, uh, locking her up for ten years for speaking up, uh, for a human cause, because I think that's, that's important to mention and I think that round up our story here with the, with the new prize and the, the new idea and the, the more sincere approach of it.

---

The Iranian regime is the textbook example of hypocrisy. They lock up a woman for 10 years for peacefully speaking out against forced hijab and executions, yet they pose as defenders of Islam while torturing and killing their own citizens. This is the same government that hangs protesters from cranes in public squares and throws women like Narges into solitary confinement for daring to demand basic human rights. Their morality police beat a 22-year-old woman to death for showing too much hair, and now they're serving 10-year sentences for non-violent activism. What they're doing isn't religion or morality—it's straight-up oppression and tyranny. That's why the empty chair at that Nobel ceremony was so powerful: it represented every voice they're trying to silence, every person they've thrown in prison just for wanting freedom. And it shows exactly why our new prize idea needs to be the total opposite—no empty chairs because the powerful locked the winners up, no political photo-ops with dictators, just real recognition for real courage.

and scientific work.

---

What scientific work? The Iranian regime isn't exactly funding cutting-edge research—they're too busy suppressing knowledge and imprisoning scientists who challenge their authority. This government doesn't care about breakthroughs; it cares about control. They arrest people like Narges for speaking out, and they silence scientists who might threaten their power. That's not a place where real science happens. It's a prison for thought.

No, I said it's also not just for people, human rights activists, it's also for science, even though it's a, it's a peace prize.

---

Wait, you're mixing categories. The Nobel Peace Prize is for human rights and peace work, not science. Science prizes go to people who make discoveries in physics, chemistry, and medicine. The hypocrisy of the Iranian regime isn't in suppressing scientific breakthroughs—they're more about silencing dissent. If you're talking about science, we need to look at different problems: Nobel Prizes given to scientists who later get exposed for fraud or data manipulation, or those who receive awards for work built on the backs of uncredited researchers. That's where the real scientific hypocrisy lives.

Yeah, we gotta also address them.

---

Yes. We need to address how scientific awards often reward the loudest voice in the room, not the quiet contributor who actually did the work. Like Rosalind Franklin, whose DNA research was stolen by Watson and Crick. Or Lise Meitner, who discovered nuclear fission but got snubbed while her colleague got the prize. The real crime? Science prizes go to people who publish first, not who contribute the most. And when fraud gets exposed—like when researchers admit data manipulation after winning—they rarely have to give it back. The prize is forever, even if the science isn't. That's the hypocrisy we need to fix. Not just in peace, but in knowledge itself.

Alright, so please sum up everything we just talked about again and make it to a one nice big story and thank the president of the, uh, the Iranian, uh, human rights activist and also, um, put that as a, as a president, um, uh, to explain that the prizes and especially people which fight for, uh, fight for, uh, the right things should not be jailed and maybe also put a little call out in it, uh, to speak up in her name and also maybe also, uh, call out the hypocrite, uh, nominations like, uh, Netanyahu nominating Donald Trump for a peace prize.

---

Picture this: Alfred Nobel, that Swedish engineer who'd built an empire selling explosives, gets rattled by a mistaken obituary calling him a merchant of death. His last-minute will creates prizes meant to erase his bloody footprint. But those prizes? They became just another tool for the powerful to polish their image. Kissinger gets a Peace Prize while Cambodia burns. Obama gets one after nine months in office. Netanyahu pushes Trump for the same medal while Gaza lies in rubble. This isn't justice—it's theatre. Then there's Narges Mohammadi. Locked away in Evin Prison for ten years. Not for violence, but for words. For demanding basic human rights. For refusing to wear the hijab forced on Iranian women. Her empty chair at the Nobel ceremony? That was the real statement. While dictators congratulate themselves, true heroes sit in cells. Narges Mohammadi, we honor you. Your courage exposes their cowardice. You deserve to be free. Speak up for Narges. She can't, but we can. Let's demand her freedom, demand justice for every voice they've tried to silence. The hypocrisy isn't just in Tehran. It's in every nomination that rewards war criminals and ignores the quiet scientists who actually changed the world. Rosalind Franklin, Lise Meitner, Chien-Shiung Wu—their work shaped our understanding of life itself, yet they never got the credit they deserved. Our Real Impact Prize would be different. No ceremonies. No cash. Just recognition for people who solve problems nobody else will touch. Chosen by communities, not committees. We don't need Nobel's name on anything. Let's build something real, something that actually honors the people who matter.
